

Abstract

A plug-in connector for a plumbing fixture includes a plug-in bushing that may be part of the plumbing fixture and a flange attached to an end of a hose or a pipe line. The flange and the plug-in bushing are configured such that when the end of the line having the flange is inserted into the plug-in bushing and turned, the flange and an undercut provided in the plug-in bushing engage one another, securing the line in the plug-in bushing and in turn in the plumbing fixture.
